

Problem Statement No. 18: AI Grant and Funding Finder for Startups

The Challenge

Developing an AI-based Grant and Funding Finder for startups poses several challenges. Funding opportunities are spread across multiple platforms, each with different formats, languages, and update frequencies, making data collection and real-time aggregation complex. Extracting relevant details such as eligibility, deadlines, and submission requirements from unstructured content requires robust natural language processing. Personalizing results based on a startup's stage, domain, and location adds another layer of complexity. Automatically generating tailored proposals or application drafts must balance accuracy and creativity while often requiring human validation. The solution must also respect legal boundaries and submission rules, especially for confidential or restricted funding portals.

Technology

Use of IBM Cloud Lite services and IBM Granite models is mandatory.
